BUREAU OF THE CENSUS

GEORGE HAY BROWN, DIRECTOR

ROBERT F. DRURY, Deputy Director
CONRAD TAEUBER, Associate Director

Population Division

HERMAN P. MILLER, Chief

ACKNOWLEDGMENTS

This report was prepared by Emmett F. Spiers and Joseph J. Knott, of the Consumer Income Statistics Branch, under the direction of Mitsuo Ono, Chief of Consumer Income Statistics Branch. General supervision was provided by Murray S. Weitzman, Assistant Chief (Economic Statistics Programs), Population Division.

SUGGESTED CITATION

U.S. Bureau of the Census, Current Population Reports, Series P-60, No. 64, "Supplementary Report on Income in 1967 of Families and Persons in the United States," U.S. Government Printing Office, Washington, D.C., 1969.

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, 70 cents. Current Population Reports issued in Series P-20, P-23, P-25, P-26, P-27, P-28 (summaries only), P-60, and P-65 are sold as a single consolidated subscription at \$8.50 per year, \$2.50 additional for foreign mailing.

SUPPLEMENTARY REPORT ON INCOME IN 1967 OF FAMILIES AND PERSONS IN THE UNITED STATES

(This report presents information on income of families and persons, most of which has not been heretofore published in any of the previously released P-60 Series income reports. Other income data for 1967 for families and persons were published separately in Current Population Reports, Series P-60, Nos. 59 and 60, respectively)

According to the March 1968 Current Population Survey, more than one out of three husband-wife families had wives in the paid labor force. As shown in table A, the percentage of husband-wife families with wives in the paid labor force increased in the past 16 years from 23 percent in 1952 to 37 percent in 1968.

About 38 percent of all white husband-wife families with heads working year-round full-time had wives in the paid labor force. The corresponding percentage for Negro families with similar characteristics was 55 percent (table B). Among all husband-wife families with husbands who were 25 years old and over and who worked year-round

full-time, the percentage of families with the wife in the paid labor force tends to increase to a peak of 43 percent when the husband is between 45 and 54 years old, but then declines to 24 percent when the husband is 65 years old or over.

Median earnings of wives (with earnings) generally tend to increase as the earnings of their husbands increase (table C). However, the ratio of the wife's median earnings to the husband's median earnings tends to fall as the level of the husband's earnings increases. Moreover, the percentage of husband-wife families with wife having earnings tends to decline as the husband's earnings increase over the \$7,000 level.

**Table A.--HUSBAND-WIFE FAMILIES BY LABOR FORCE
STATUS OF WIFE: MARCH 1952 TO MARCH 1968**

(Numbers in thousands)

NA Not available.

¹ Current labor force status is as of the week preceding the March Survey (calendar) week which includes the 19th day of the month.

² Figure for 1968 obtained from Current Population Reports, Series P-60, No. 59, table 10, p. 32; figures for 1952 to 1967, from Series P-60, No. 53, table D, p. 3.

About 46 percent of all husband-wife families with heads who worked last year as a clerical or service worker had wives in the paid labor force (table D). The comparable rate was 22 percent when the husband's occupation was either a farmer or farm manager.

RELATED REPORTS

Current Population Survey.--Other data based on the Current Population Survey showing the distributions of households, families, unrelated individuals, and persons, by income levels, have been published in the Series P-60 reports, Nos. 1 to 63. Occasionally, tables showing the cross-classification of income and other characteristics have been published in the Series P-20 reports of the Bureau of the Census and in the Bureau of Labor Statistics, Special Labor Force Reports.

A historical and analytical summary of the income data collected in the Current Population Survey appears in Technical Paper No. 8, Trends in the Income of Families and Persons in the United States: 1947 to 1960, published in 1963. This report contains detailed tables showing income distributions in constant (1959) dollars, mean incomes, fifths, and Gini Ratios of families and unrelated individuals cross-classified by various characteristics, for the United States, urban and rural. Similar data are also shown for males and females classified by the amount of their own income and various personal characteristics.

¹ Husband's earnings estimated at midpoint of income interval shown in column 1. Husband's median earnings for the \$25,000 and over class were estimated at \$36,000.

A report entitled Technical Paper No. 17, Trends in the Income of Families and Persons in the United States: 1947 to 1964, issued in 1967, updates the information contained in Technical Paper No. 8. This report includes essentially the same information as Technical Paper No. 8 except for the following: Technical Paper No. 8 shows income data in terms of constant 1959 dollars whereas this report updates and revises income information in terms of constant 1964 dollars. Income data and various characteristics are cross-classified by nonfarm and farm rather than by urban and rural

categories. In addition, new income information covering work experience, occupation of longest job, and source of income has been added.

1960 Census.--Income data collected in the 1960 Census of Population appear in a number of published reports. Basic distributions of persons 14 years old and over, families, and unrelated individuals, by money income in 1959, for the United States, each of the States, counties, standard metropolitan statistical areas, urbanized areas, and urban places are presented in 1960 Census of Population,

Table D.--HUSBAND-WIFE FAMILIES WHOSE HEAD WORKED IN 1967 BY LABOR FORCE STATUS OF WIFE AS OF MARCH 1968, BY OCCUPATION OF LONGEST JOB AND MEDIAN EARNINGS OF HUSBAND

¹ Current labor force status is as of the week preceding the March Survey (calendar) week which includes the 19th day of the month.

Vol. I, Characteristics of the Population, chapter C, "General Social and Economic Characteristics." Statistics on income in 1959 by detailed characteristics, including cross-classifications by age, weeks worked, education, type of family, etc., are presented in 1960 Census of Population, Vol. I, Characteristics of the Population, chapter D, "Detailed Characteristics," for some or all of the following areas: United States, each of the States, large counties, and standard metropolitan statistical areas of 250,000 or more.

Detailed cross-classifications on the income in 1959 of families and persons by their social and economic characteristics, for the United States, regions, and type of residence are published in 1960 Census of Population, Subject Reports, Sources and Structure of Family Income, Series PC(2)-4C. Major emphasis is placed on the composition of family income and the major sources of this income, i.e., wages and salaries, self-employment, and other income. The tables for persons present information on the contribution to family income of the head, wife, children, and older family members and show the mean incomes for occupation groupings cross-classified by industry groupings, color, and sex.

Cross-tabulations by earnings in 1959, age, and educational attainment of males 18 to 64 years old, for the United States, the South, and the other three regions combined are published in 1960 Census of Population, Occupation by Earnings and Education, Series PC(2)-7B. Data on the income of families in which the head or the wife was 65 years old and over and on the income of persons 65 years old and over

classified by a number of characteristics are presented for the United States, each of the States, and standard metropolitan statistical areas of 250,000 or more in 1960 Census of Population, Income of the Elderly Population, Series PC(2)-8B.

Statistics on income in 1959 of primary families or individuals by housing and household characteristics, such as tenure, household composition, condition and plumbing facilities, and gross rent and value, are presented in 1960 Census of Housing, Volume II, Metropolitan Housing, for the United States by geographic divisions and for each standard metropolitan statistical area and place of 100,000 inhabitants or more. Additional data on income cross-tabulated by housing and household subjects are presented in 1960 Census of Housing, Volume V, Part 1, Residential Finance--Homeowner Properties; Volume VI, Rural Housing; and Volume VII, Housing of Senior Citizens. Also, a monograph, Income Distribution in the United States, sponsored jointly by the Bureau of the Census and the Social Science Research Council, was published in 1966. Technical Paper No. 16, Present Value of Estimated Lifetime Earnings, by H. P. Miller and R. Hornseth, published in 1967, presents estimates of the present value of estimated lifetime earnings for men in 10 major occupation groups classified by color, earnings, and years of school completed.

Statistics on income in 1959 collected in the Current Population Survey of March 1960 may differ from data for that year from the decennial census despite the fact that the same basic concept was used in both instances.

In the first place, the survey data exclude the institutional population and most members of the Armed Forces living on post. These two groups were included in the census. Secondly, college students are generally enumerated at their own homes in the Current Population Survey and classified as family members, but were enumerated at their college residence in the census, usually as secondary individuals. Thirdly, the small group of Current Population Survey enumerators were more experienced and had more intensive training and supervision than the large number of temporary census enumerators and may have more often obtained more accurate answers from respondents. Moreover, income data in the Current Population Survey are based on responses to separate questions on eight detailed types of income, whereas in the census only three broad questions were used.

1950 Census.--Distributions of persons 14 years old and over by total money income in 1949 appear in the publication, U.S. Bureau of the Census, 1950 Census of Population, Volume II, chapter C. Similar data for families and unrelated individuals appear in Volume II, chapter B. Data for the United States and regions appear in Volume II, Part I, United States Summary, whereas separate data for individual States are presented in the other parts. Various special reports contain additional income data; however, there is no special report dealing exclusively with income data. In addition, a monograph, Income of the American People, sponsored jointly by the Bureau of the Census and the Social Science Research Council, was published in 1955.

1940 Census.--Data relating to wage and salary income in 1939 have been presented in several different reports of the Sixteenth Decennial Census. A complete list of these reports is shown in earlier Current Population Survey reports on consumer income.

DEFINITIONS AND EXPLANATIONS

Population coverage.--This report includes the civilian noninstitutional population of the United States and approximately 1,078,000 members of the Armed Forces in the United States living off post or with their families on post in 1968, but excludes all other members of the Armed Forces.

Farm-nonfarm residence.--The farm population refers to rural residents living on farms. The method of determining farm-nonfarm residence in the March 1968 survey and in the Current Population Surveys since March 1960 is the same as that used in the 1960 Census but differs from that used in earlier surveys and censuses. Since March 1960

in the Current Population Surveys, farm residence has been determined by the responses to two questions. Owners are asked "Does this place have 10 or more acres?" and renters are asked "Does the place you rent have 10 or more acres?" If the response is "Yes," the respondent is asked "During the past 12 months, did sales of crops, livestock, and other farm products from this place amount to \$50 or more?" If the acreage response is "No," the inquiry relates to sales of \$250 or more. Rural persons in institutions, motels, and tourist camps, and those living on rented places where no land is used for farming, are not classified as farm population.

The nonfarm population, as the term is used here, comprises persons living in urban areas and rural persons not on farms.

Metropolitan-nonmetropolitan residence.--The population residing in standard metropolitan statistical areas (SMSA's) constitutes the metropolitan population. Except in New England, an SMSA is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county, or counties, containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central city. In New England, SMSA's consist of towns and cities, rather than counties. The metropolitan population in this report is based on SMSA's as defined in the 1960 Census and does not include any subsequent additions or changes.

Central cities.--Each SMSA must include at least one central city, and the complete title of an SMSA identifies the central city or cities. If only one central city is designated, then it must have 50,000 inhabitants or more. The area title may include, in addition to the largest city, up to two city names on the basis and in the order of the following criteria: (1) The additional city has at least 250,000 inhabitants or (2) the additional city has a population of one-third or more of that of the largest city and a minimum population of 25,000. An exception occurs where two cities have contiguous boundaries and constitute, for economic and social purposes, a single community of at least 50,000, the smaller of which must have a population of at least 15,000.

Household.--Through 1959, a household included all of the persons who occupied a house, an apartment, or other group of rooms, or a room, which constituted a dwelling unit under the 1950 Census rules. Since 1960, a household includes all of the

persons who occupy a house, an apartment, or other group of rooms, or a room, which constitutes a housing unit under the 1960 Census rules.

Dwelling unit, 1950.--A group of rooms occupied as separate living quarters was regarded as a dwelling unit if it had separate cooking equipment or a separate entrance; a single room occupied as separate living quarters was a dwelling unit if it had separate cooking equipment, or, if in a regular apartment house, most of the units had separate cooking equipment, or if it constituted the only living quarters in the structure. The count of households excluded groups of persons living as members of a quasi-household. A quasi-household was defined as the occupants of a rooming house containing five or more persons not related to the head, or the occupants of certain other types of living quarters such as dormitories, military barracks, and institutions.

Housing unit, 1960.--A group of rooms or a single room is regarded as a housing unit when it is occupied as separate living quarters, that is, when the occupants do not live and eat with any other persons in the structure, and when there is either (1) direct access from the outside or through a common hall, or (2) a kitchen or cooking equipment for the exclusive use of the occupants. The count of households excludes persons living in group quarters. The kinds of living quarters occupied by quasi-households under the 1950 definitions generally are group quarters under the 1960 definitions. Some quarters formerly regarded as occupied by quasi-households, however, have been divided into housing units because the occupants live separately and their quarters qualify as housing units under the 1960 definition.

Family.--The term "family," as used in this report, refers to a group of two or more persons related by blood, marriage, or adoption and residing together; all such persons are considered as members of the same family. Thus, if the son of the head of the household and the son's wife are in the household, they are treated as part of the head's family. On the other hand, a lodger and his wife not related to the head of the household or an unrelated servant and his wife are considered as additional families, and not as part of the household head's family.

Subfamily.--A subfamily is a married couple with or without children, or one parent with one or more own single children under 18 years old, living in a household and related to, but not including, the head of the household or his wife. The most common example of a subfamily is a young married couple sharing the home of the husband's or wife's parents. Members of a subfamily are

also members of a primary family. The number of subfamilies, therefore, is not included in the number of families.

Unrelated individual.--The term "unrelated individuals," as used in this report, refers to persons 14 years old and over (other than inmates of institutions) who are not living with any relatives. An unrelated individual may constitute a one-person household by himself, or he may be part of a household including one or more other families or unrelated individuals, or he may reside in group quarters such as a rooming house. Thus, a widow living by herself or with one or more other persons not related to her, a lodger not related to the head of the household or to anyone else in the household and a servant living in an employer's household with no relatives are examples of unrelated individuals.

Primary families and individuals.--The term "primary family" refers to the head of a household and all other persons in the household related to the head by blood, marriage, or adoption. If nobody in the household is related to the head, then the head himself constitutes a "primary individual." A household can contain one and only one primary family or primary individual. The number of "primary" families and individuals is identical with the number of households.

Secondary individual.--A secondary individual is a person, such as a lodger, guest, or resident employee, who is not related to any other person in the household or group quarters.

Income.--For each person in the sample 14 years old and over, questions were asked on the amount of money income received in 1967 from each of the following sources: (1) Money wages or salary; (2) net income from nonfarm self-employment; (3) net income from farm self-employment; (4) Social Security; (5) dividends, interest (on savings or bonds), income from estates or trusts or net rental income; (6) public assistance or welfare payments; (7) unemployment compensation, government employee pensions, or veterans' payments; (8) private pensions, annuities, alimony, regular contributions from persons not living in this household, net royalties, and other periodic income.

The amounts received represent income before deductions for personal taxes, Social Security, bonds, etc. When an indefinite amount was reported by the respondent, a specific value was assigned during processing wherever possible. If the indefinite amount was reported in terms of a range, the midpoint of the range was assigned (i.e., \$10,000 to \$15,000 was coded as \$12,500). Open-ended amounts were converted to designated specific amounts; e.g., over \$10,000 was coded as \$16,000.

It should be noted that although the income statistics refer to receipts during 1967 the characteristics of the person, such as age, labor force status, etc., and the composition of families refer to March 1968. The income of the family does not include amounts received by persons who were members of the family during all or part of the calendar year 1967 if these persons no longer resided with the family at the time of enumeration. On the other hand, family income includes amounts reported by related persons who did not reside with the family during 1967 but who were members of the family at the time of enumeration.

Data on consumer income collected by the Bureau of the Census cover money income (exclusive of certain money receipts such as capital gains) prior to deductions for taxes. The fact that many farm families receive part of their income in the form of rent-free housing and goods produced and consumed on the farm, rather than in money, should be taken into consideration in comparing the income of farm and nonfarm residents. It should be noted that nonmoney incomes are also received by some nonfarm residents. They often take the form of business expense accounts, use of business transportation and facilities, full or partial compensation by business for medical and educational expenses, etc. In analyzing size distributions of income, it should be recognized that capital gains tend to be concentrated more among higher income units than among lower ones.

Money wages or salary.--This is defined as the total money earnings received for work performed as an employee during the calendar year 1967. It includes wages, salary, Armed Forces pay, commissions, tips, piece-rate payments, and cash bonuses earned, before deductions were made for taxes, bonds, pensions, union dues, etc.

Net income from nonfarm self-employment.--This is defined as net money income (gross receipts minus expenses) from his own business, professional enterprise, or partnership. Gross receipts include the value of all goods sold and services rendered. Expenses include costs of goods purchased, rent, heat, light, power, depreciation charges, wages and salaries paid, business taxes (not personal income taxes), etc. In general, inventory changes were not considered in determining net income; however, replies based on income tax returns or other official records do reflect inventory changes. The value of salable merchandise consumed by the proprietors of retail stores is not included as part of net income.

Net income from farm self-employment.--This is defined as net money income (gross receipts minus operating expenses) from the operation of a farm by a person on his own account, as an owner,

renter, or sharecropper. Gross receipts include the value of all products sold, government crop loans, money received from the rental of farm equipment to others, and incidental receipts from the sale of wood, sand, gravel, etc. Operating expenses include cost of feed, fertilizer, seed, and other farming supplies, cash wages paid to farmhands, depreciation charges, cash rent, interest on farm mortgages, farm building repairs, farm taxes (not State and Federal income taxes), etc. The value of fuel, food, or other farm products used for family living is not included as part of net income. In general, inventory changes were not considered in determining net income; however, replies based on income tax returns or other official records do reflect inventory changes.

Social Security.--This is defined as Social Security pensions and survivors' benefits, and permanent disability insurance payments made by the Social Security Administration and railroad retirement insurance checks from the U.S. Government.

Dividends, interest (on savings or bonds), income from estates or trusts, or net rental income.--This category includes dividends from stockholdings or membership in associations, interest on savings or bonds, periodic receipts from estates or trust funds, net income from rental of a house, store, or other property to others, and receipts from boarders or lodgers.

Public assistance or welfare payments.--This category includes public assistance payments such as old-age assistance, aid to families with dependent children, and aid to the blind or totally disabled.

Unemployment compensation, government employee pensions, or veterans' payments.--This category includes: (1) Unemployment compensation received from government unemployment insurance agencies or private companies during periods of unemployment and any strike benefits received from union funds; (2) government employee pensions received from retirement pensions paid by Federal, State, county, or other governmental agencies to former employees (including members of the Armed Forces) or their survivors; (3) money paid periodically by the Veterans' Administration to disabled members of the Armed Forces or to survivors of deceased veterans, subsistence allowances paid to veterans for education and on-the-job training, as well as so-called "refunds" paid to ex-servicemen as GI insurance premiums; also includes (4) workmen's compensation received periodically from public or private insurance companies for injuries incurred at work. The cost of this insurance must have been paid by the employer and not by the person.

Private pensions, annuities, alimony, regular contributions from persons not living in the household, royalties, and other periodic income.--The following types of income are included in this group:

(1) Private pensions or retirement benefits paid to a retired person or his survivors by a former employer or by a union, either directly or through an insurance company; (2) periodic receipts from annuities or insurance; (3) alimony and child support; (4) contributions received periodically from persons not living in the household; (5) net royalties; and (6) other periodic income such as military family allotments, net gambling winnings, and other kinds of periodic income other than earnings.

Receipts not counted as income.--Receipts from the following sources were not included as income: (1) Money received from the sale of property, such as stocks, bonds, a house, or a car (unless the person was engaged in the business of selling such property, in which case the net proceeds would be counted as income from self-employment); (2) withdrawals of bank deposits; (3) money borrowed; (4) tax refunds; (5) gifts; and (6) lump-sum inheritances or insurance payments.

Total money earnings.--These are defined as the algebraic sum of money wages or salary and net income from farm and nonfarm self-employment.

Total money income.--This is defined as the algebraic sum of money wages and salaries, net income from self-employment, and income other than earnings. The total income of a family is the algebraic sum of the amounts received by all income recipients in the family.

The income tables for families and unrelated individuals include in the lowest income group (under \$1,000) those that were classified as having no income in 1967 and those reporting a loss in net income from farm and nonfarm self-employment or in rental income. Many of these were living on income "in kind," savings, or gifts; or were newly constituted families, unrelated individuals who had recently left families, or families in which the sole breadwinner had recently died or had left the household. However, many of the families and unrelated individuals who reported no income probably had some money income which was not recorded in the survey.

Head of family.--One person in each family was designated as the head. The head of a family is usually the person regarded as the head by members of the family. Women are not classified as heads if their husbands are resident members of the family at the time of the survey. Married couples

related to the head of a family are included in the head's family and are not classified as separate families.

Married, wife present.--A man was classified as "married, wife present" if his wife was reported as a member of the household or a group quarter, even though she may have been temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration.

Size of family.--The term "size of family" refers to the number of persons who are living together and who are related to each other by blood, marriage, or adoption.

Own children.--"Own" children in a family are single (never married) sons and daughters, including stepchildren and adopted children, of the family head.

Number of earners.--This number includes all persons in the family with \$1 or more in wages and salaries, or \$1 or more or a loss in net income from farm or nonfarm self-employment.

Age.--The age classification is based on the age of the person at his last birthday.

Color and race.--The term "color" refers to the division of the population into two groups, white and nonwhite. The nonwhite group includes Negroes, Indians, Japanese, Chinese, and other nonwhite races. This report, generally includes data for white and Negro only.

Years of school completed.--Data on years of school completed in this report were derived from the combination of answers to questions concerning the highest grade of school attended by the person and whether or not that grade was completed. The questions on educational attainment apply only to progress in "regular" schools. Such schools include graded public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, regular schooling is that which may advance a person toward an elementary school certificate or a high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

The median years of school completed is defined as the value which divides the distribution into two equal groups, one having completed more schooling and one having completed less schooling than the median. These medians are expressed in terms of

a continuous series of numbers representing years of school completed. For example, a median of 9.0 represents the completion of the first year of high school and a median of 13.0 means completion of the first year of college.

Labor force and employment status.--The definitions of labor force and employment status in this report relate to the population 14 years old and over.

Employed.--Employed persons comprise (1) all civilians who, during the specified week, did any work at all as paid employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family, and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor-management dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether or not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work around the house (such as own home housework, painting or repairing own home, etc.) or volunteer work for religious, charitable, and similar organizations.

Unemployed.--Unemployed persons are those civilians who, during the survey week, had no employment but were available for work and (1) had engaged in any specific jobseeking activity within the past 4 weeks, such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register; (2) were waiting to be called back to a job from which they had been laid off; or (3) were waiting to report to a new wage or salary job within 30 days.

Labor force.--Persons are classified as in the labor force if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" is comprised of all civilians classified as employed or unemployed.

Not in the labor force.--All civilians who are not classified as employed or unemployed are defined as "not in the labor force." This group who are neither employed nor seeking work includes persons engaged only in own home housework, attending school, or unable to work because of long-term physical or mental illness; persons who are retired or too old to work, seasonal workers for whom the survey week fell in an off season, and the

voluntarily idle. Persons doing only unpaid family work (less than 15 hours) are also classified as not in the labor force.

Paid labor force.--Persons are classified in the paid labor force if they were employed as wage and salary workers or self-employed workers during the survey week or were looking for work at the time and had last worked as wage and salary or self-employed workers.

Occupation and class of worker.--The data on occupation of family head in tables 6 and 8 refer to the civilian job held longest during the preceding calendar year.

In table 7 family heads are grouped into four class-of-worker groups according to their longest job last year: Private wage or salary, government wage or salary, self-employed, and unpaid family. Private wage or salary includes persons who are employed by any private enterprise. Government wage or salary includes all persons who are employed by any governmental unit. Self-employed refers to persons working in their own business, profession or trade for profit or fees. Unpaid family workers are persons working without pay in a business operated by a member of the household to whom they are related by blood, marriage, or adoption.

The occupation and industry groupings used here are mainly the major groups used in the 1960 Census of Population. The composition of these groups is shown in Volume I, Characteristics of the Population, Part 1, United States Summary, chapter D. The categories used are either detailed classifications or combinations thereof.

Work experience in 1967.--A person with work experience in 1967 is one who did any civilian work for pay or profit or worked without pay on a family-operated farm or business at any time during the year, on a part-time or full-time basis.

Weeks worked in 1967.--Persons are classified according to the number of different weeks during 1967 in which they did any civilian work for pay or profit (including paid vacations and sick leave) or worked without pay on a family-operated farm or business.

Part-time or full-time jobs.--A person is classified as having worked at part-time jobs during 1967 if he worked at civilian jobs which provided less than 35 hours of work per week in a majority of the weeks in which he worked during the year. He is classified as having worked at full-time jobs if he worked 35 hours or more per week during a majority of the weeks in which he worked.

Year-round full-time worker.--A year-round full-time worker is one who worked primarily at full-time civilian jobs (35 hours or more per week) for 50 weeks or more during 1967.

Nonworker.--A nonworker is one who did not do any civilian work in 1967.

Median income.--The median income is the amount which divides the distribution into two equal groups, one having incomes above the median, and the other having incomes below the median. The medians for families and individuals are based on all families and individuals. The medians for persons are based on the distributions of persons with income. The medians for wage or salary income, income from nonfarm self-employment, income from farm self-employment, and income other than earnings are based on the distributions of persons or families and individuals having these types of income.

The difference in the size of the income intervals used to compute median income can have a sizable effect on interpolated median values. As a general rule, median income values published earlier in the Series P-60 reports are calculated using the income intervals shown in the tables in which the median values are shown. In the present report, income intervals are shown in greater detail in table 17 than they are in most of the remaining persons tables; in the income range from \$3,000 to \$4,999, the intervals are \$500 in table 17 but \$1,000 in the other persons tables. Consequently, medians based on the intervals shown in table 17 would be different from those in other persons tables. For example, median income for Negro males who worked year round full time is \$4,753 when based on intervals in table 17 and \$4,837 when based on the broader intervals in the other persons tables. For consistency from table to table, medians shown in table 17, therefore, were computed from intervals shown in the other persons tables rather than from those in table 17.

Since the income intervals of most tables have been revised for the reports on 1967 income data, there is also some lack of comparability between medians shown in this report and those in earlier reports. It should be noted that the median value is affected only when the income interval containing the median value has been changed. Comparable medians can be computed by combining categories as necessary to obtain identical income intervals for the years being compared.

Mean income.--The mean income is the amount obtained by dividing the total income of a group by the number of families, unrelated individuals, or persons (as appropriate) in that group.

Rounding.--Percentages are rounded to the nearest tenth of a percent; therefore, the percentages in a distribution do not always add to exactly 100.0 percent. The totals, however, are always shown as 100.0.

Base figures.--An estimate of the size of the base (number of families, individuals, or persons) of each percent distribution by income in 1967 is shown in most of the tables in this report.

The base figures shown in this report for 1961 through 1967 were prepared by inflating weighted sample results to agree with independent estimates of the population based on statistics updated from the 1960 Census, whereas the base figures for years prior to 1961 were prepared by weighting the sample figures to agree with statistics updated from the 1950 Census.

COMPARABILITY OF CURRENT POPULATION SURVEY INCOME DATA WITH OTHER DATA

Office of Business Economics personal income series.--The income data presented in this report are not directly comparable with estimates of aggregate personal income prepared by the Office of Business Economics of the Department of Commerce (OBE), nor with the distributions of families and unrelated individuals by family personal income brackets published by that Office. The lack of correspondence stems from the following differences in definition and coverage:

1. Income definition.--The personal income series includes, among other items, the following types of nonmoney income which are not included in the census definition: Wages received in kind, the value of food and fuel produced and consumed on farms, the net rental value of owner-occupied homes, the property income received by mutual life insurance companies, and the value of the services of banks and other financial intermediaries rendered to persons without the assessment of specific charges. These items of income in kind account for about 5 percent of total personal income. The Census Bureau definition of income, on the other hand, includes such items as regular contributions for support received from persons who do not reside in the same living quarters, income received from roomers and boarders residing in households, and employee contributions for social insurance, which are not included in the personal income series. These items, however, represent a much smaller income total than the nonmoney items included in personal income.

2. Source of data.--The personal income series is estimated largely on the basis of data derived from business and governmental sources. These sources include the industrial and population

censuses, employers' wage reports under the Social Security programs, and records of disbursements to individuals by governmental agencies. The OBE's distributions of families and unrelated individuals by family personal income brackets, which are based on consolidated data from Federal individual income tax returns supplemented by information from field surveys of family income, have been adjusted to agree statistically with the totals in the personal income series. The income data presented in the census reports, on the other hand, are based directly on field surveys of households. As discussed in the section on "Source and reliability of the estimates," income data obtained in household interviews are subject to various types of reporting errors which tend to produce an understatement of income. It is estimated that the income surveys conducted by the Bureau of the Census during the past few years have obtained about 90 percent of the comparable total money income aggregates and about 97 percent of the comparable money wage or salary aggregates included in the personal income series prepared by the OBE.

3. Population coverage.--The Bureau of the Census excluded from its sample inmates of institutions and military personnel overseas or living on post in the United States. In addition the income of persons who dies or emigrated prior to the date of interview was not reported in the census inquiry. The income of these groups is included in the aggregate personal income series released by the OBE but is excluded from the OBE's family income distributions.

4. Average income.--Most of the average income figures published by the OBE represent mean personal incomes, i.e., they were obtained by dividing an aggregate personal income by a total number of persons (or families). The census averages in this report, on the other hand, are median incomes, representing the point on the money income scale above and below which one-half of the families (or of the persons receiving income) are to be found. Because of the shape of the income distribution curve, median incomes are generally smaller than mean incomes. Furthermore, certain of the OBE average income figures (e.g., for geographical regions) represent income per capita, i.e., they were derived by dividing total income by the total population including men, women, and children. Most of the census averages, in contrast, are for families (or for unrelated individuals or income recipients 14 years old and over).

Percent changes in average income from one period to the next, and percent differences in average income among component groups of the population within any one period, will not necessarily correspond for these various averages.

This is so because the shape of the income distribution curve changes over time and varies among population groups at any given time, and because the average size of family also varies over time and among groups. As an example of the latter point, the average size of family had increased during the early 1950's so that it can be expected, barring other differences, that a smaller percentage rise in average income for the period will be shown by a series computed on a per capita than on a per family basis. The amount of divergence will vary depending on the extent to which average family size has increased in the particular region or other grouping of the population under consideration.

Department of Agriculture farm income series.--The farm income data shown in this report are not directly comparable with estimates of the aggregate amount of income received by the farm population and estimates of the aggregate farm income of farm operators which are prepared by the Economic Research Service of the Department of Agriculture. Data from the two sources differ in several respects for the reasons cited below:

1. The census data show distributions of persons by farm self-employment income levels and distributions of persons by total money income levels, but do not show estimates of the amount of aggregate income. Agriculture estimates provide information on the amount of aggregate income received by the population but do not provide distributions by income level.

2. The agriculture estimates are based on data derived from farm, business, and governmental sources. As indicated previously, the data presented in this report are based on a field survey of households.

3. The definitions of income are different. The census definition includes, among others, the following items which are not included in the agriculture series: Contributions for support received from persons not residing in the same living quarters and government and business transfers of income.

4. The census data on the total money income of the farm population differ from the agriculture estimates of "net income of the farm population" for reasons other than those cited previously, as follows:

a. The census data do not include under the farm classification the incomes of those nonfarm residents who reported the receipt of some farm income while the agriculture series includes the total net farm income of all farm operators.

b. Income in kind--the imputed value of farm products grown and consumed directly in farm households, and the imputed rental value of owner-occupied farm dwellings--is included in the agriculture series but excluded from the census definition of income.

5. The census data on the civilian non-institutional population's net income from the operation of a farm differ from the agriculture estimates of farm operators' "net cash income from farming" for reasons other than those cited above, as follows:

a. The census estimates are based on the answers to a single direct question on how much net income was derived from operation of a farm during the preceding calendar year. The agriculture series on "net cash income from farming" is derived by summing estimated cash receipts for a large number of crop and livestock items, and subtracting estimates of the various kinds of cash production expenses incurred.

b. The agriculture series includes the net income of farm operators from the rental of farms to other farmers but the census definition classifies these receipts as income other than earnings, not income from farm self-employment.

c. The agriculture definition of farm expenses used in deriving "net cash income from farming" includes actual expenditures on the repair, construction, or purchase of buildings, machinery, and other capital equipment added on the place while the census definition includes only the money spent on repairs. On the other hand, depreciation charges are treated as farm expenses under the census definition but not in the agriculture series on "net cash income from farming."

Surveys of Consumer Finances.--The Survey of Consumer Finances which has been conducted annually by the Survey Research Center of the University of Michigan provides, among other data, information on the size distribution of income. These surveys are based on nationwide samples that cover all persons in private households. Several important differences between the Survey of Consumer Finances and the present report may be noted:

1. The income-receiving unit in the Survey of Consumer Finances estimates is the spending unit or the family, whereas the data in the present report relate to persons 14 years old and over and to families.

2. The Survey of Consumer Finances estimates are based on a sample which is different from and smaller (approximately 2,000 spending units in 66 areas) than the census sample. Differences between the results are subject to sampling variability arising from each survey. This factor alone could account for moderate discrepancies between the two sets of data.

3. There are some differences in the estimating procedure. The Bureau of the Census inflated its weighted sample results to agree with independent estimates of the civilian population of the United States by age, color, and sex, whereas the Survey of Consumer Finances weighted sample results were inflated to agree with independent estimates of occupied dwelling units.

4. Only eight income questions are asked for each person in the Bureau of the Census sample whereas numerous detailed questions on income and other financial items are asked of the head of the spending unit and all other members in the spending unit in each household in the Survey of Consumer Finance sample.

Federal income tax data.--For several reasons, the income data shown in this report are not directly comparable with those which may be obtained from statistical summaries of income tax returns. Income, as defined for tax purposes, differs somewhat from the concept used by the Bureau of the Census. For example, certain types of receipts such as veterans' payments, Social Security benefits, and relief payments, which constitute the main income source for some families, are excluded from income tax coverage. Moreover, the coverage of income tax statistics is less inclusive because persons receiving less than \$600 (less than \$1,200, if 65 years old and over) are not required to file returns. Furthermore, some income tax returns are filed as separate returns and others as joint returns; and, consequently, the income reporting unit is not consistently either a family or a person.

Old-Age, Survivors', and Disability Insurance earnings record data.--Census data shown in this report and the distributions made upon the basis of Old-Age, Survivors', and Disability Insurance earnings record data differ for the reasons listed below:

1. The earnings of the following groups are not covered by the earnings record data: Many Federal, State, and local government employees, some employees of nonprofit organizations, workers covered by the Railroad Retirement Act, and persons who are not covered by the program because of insufficient earnings, including some farm and nonfarm self-employed persons, some farm workers and domestic servants.

2. Employees' earnings in excess of \$6,600 per employer are not covered by the earnings record data.

3. Income other than earnings is not covered by the earnings record data.

4. The earnings record data are based upon employers' Social Security tax reports and the Federal income tax returns of self-employed persons, whereas the data presented in this report are obtained by household interviews.

In most cases the schedule entries for income are based on memory rather than on records, and in the majority of cases on the memory or knowledge of one person, usually the wife of the family head. The memory factor in data derived from field surveys of income probably produces underestimates because the tendency is to forget minor or irregular sources of income. Other errors of reporting are due to misrepresentation or to misunderstanding as to the scope of the income concept.

The standard error is primarily a measure of sampling variability, that is, of the variations that occur by chance because a sample rather than the entire population is surveyed. As calculated for this report, the standard error also partially measures the effect of response and enumeration errors, but it does not measure, as such, any systematic biases in the data. The chances are about 68 out of 100 that an estimate from the sample would differ from a complete census figure by less than the standard error. The chances are about 95 out of 100 that the difference would be less than twice the standard error.

The figures presented in table E are approximations to the standard errors of various estimates shown in this report. In order to derive standard errors that would be applicable to a wide variety of items and could be prepared at a moderate cost, a number of approximations were required. As a result, the table of standard errors provides an indication of the order of magnitude of the standard errors rather than the precise standard error for any specific item.

The reliability of an estimated percentage, computed by using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which the percentage is based. Estimated percentages are relatively more reliable than the corresponding absolute estimates of the numerator of the percentage, particularly if the percent is large (50 percent or greater). Table E shows the standard errors of the estimated percentage of families and persons in a given category.

SOURCE AND RELIABILITY OF THE ESTIMATES

Source of data.--The estimates are based on data obtained in the Current Population Survey of the Bureau of the Census. Most of the data was collected in March 1968, though one table contains data collected in March of other years. For 1967 and 1968 the sample is spread over 449 areas comprising 863 counties and independent cities, with coverage in each of the 50 States and the District of Columbia. Approximately 50,000 households are designated in the Current Population Survey for interview each month. Of this number, 2,250 occupied units, on the average, are visited but interviews are not obtained because the occupants are not found at home after repeated calls or are unavailable for some other reason. In addition to the 50,000 there are also about 8,500 sample units in an average month which are visited but are found to be vacant or otherwise not to be enumerated. For the years prior to 1967, the sample was spread over fewer areas with fewer interviewed households. Prior to the March 1966 survey, income data was collected from only 75 percent of the households included in the CPS. See *Current Population Reports, Series P-23, No. 22, "Concepts and Methods Used in Manpower Statistics from the Current Population Survey,"* June 1967, pp. 7-10, for more information about the sample design.

The estimation procedure used in this survey involved the inflation of the weighted sample results to independent estimates of the civilian non-institutional population of the United States by age, color and sex. These independent estimates were based on statistics from the 1960 Census of Population; statistics of births, deaths, immigration, and emigration; and statistics on the strength of the Armed Forces. To these totals were added the population in the Armed Forces living off post or with their families on post. A further adjustment was made so that all members of a household got the same weight while at the same time leaving unchanged the estimates for certain basic labor force categories.

Reliability of the estimates.--Since the estimates in this report are based on a sample, they may differ somewhat from the figures that would have been obtained from a complete census, using the same schedules, instructions, and enumerators. Particular care should be exercised in the interpretation of figures based on relatively small numbers of cases as well as small differences between figures. As in any survey work, the results are subject to errors of response and non-reporting and to sampling variability.

Illustration of use of the table of standard errors of percentages.--Table B shows that an estimated 38.8 percent of all husband-wife families

contained wives in the paid labor force in 1968. Since the base of this percentage is 30,653,000 families, interpolation in table E shows that the standard error of the estimated 38.8 percent is approximately 0.4 percent. Therefore, chances are 68 out of 100 that the estimated 38.8 percent would be within 0.4 percent of a complete census figure, and chances are 95 out of 100 that the estimate would be within 0.8 percent of a census figure. That is, the 95 percent confidence interval would be between 38.0 and 39.6 percent.

The tables in this report present estimates of median income as well as the corresponding distributions. The sampling variability of an estimated median depends upon the distribution as well as on the size of the base.

Confidence limits of a median based on sample data may be estimated as follows:

1. From table E using the appropriate base, determine the standard error of a 50-percent characteristic;

2. Add to and subtract from 50 percent the standard error determined in step (1); and

3. Determine the confidence interval for the median corresponding to the two points established in step (2) by reading off the corresponding values from the distribution of the characteristic. A two-standard error confidence limit may be determined by finding the values corresponding to 50 percent plus and minus twice the standard error shown in table E.

Illustration of the computation of the standard error of a median.--The median income of all families whose head is a year-round full-time worker is \$9,314 (table 10). There were an estimated 33,093,000 families of this type.

1. From table E, the standard error of 50 percent of these is about 0.5 percent.

2. Since we usually are interested in the confidence interval for the median at the two-standard error level, we add and subtract twice the standard error obtained in step 1. This yields percentage limits of 49.0 and 51.0.

3. About 47.3 percent of the 33,093,000 families whose head was a year-round full-time worker had income below \$9,000. The \$9,000-\$9,999 income interval contain 8.4 percent of the families. By linear interpolation the upper limit is found to be \$9,440.

$$\frac{51.0 - 47.3}{8.4} \times \$1,000 + \$9,000 = \$9,440$$

Also by linear interpolation the lower limit is found to be \$9,202.

$$\frac{49.0 - 47.3}{8.4} \times \$1,000 + \$9,000 = \$9,202$$

Therefore, the 95 percent confidence interval is \$9,202 to \$9,440.

Approximating the standard error of a mean: To get a rough estimate of the standard error of a mean, the following formula can be used:

$$\sigma_{\bar{x}}^2 = R \left[\frac{\sum_{i=1}^c p_i x_i^2}{n} - \frac{\bar{x}^2}{n} \right]$$

where n is the weighted total number of cases in all c income classes. p_i is the proportion of total cases in the i^{th} income class. x_i is the midpoint of the i^{th} class.

\bar{x} is the mean income of the distribution $\sum_{i=1}^c p_i x_i$

R is a constant which depends on the sample size, the sample design, and the estimation procedure. For calculations in this report, $R = 1,800$ may be used. To obtain an estimated standard error for a mean income, find $\sigma_{\bar{x}}^2$ and take the square root.

Table E.--STANDARD ERRORS OF ESTIMATED PERCENTAGE OF FAMILIES AND PERSONS

Estimated percentage	Base of estimated percentage (thousands)

Cross-classification of income and work experience data.--This report presents data showing income of persons with varying amounts of work experience in 1967. Information about the civilian work experience of persons in the United States was obtained in the February and April 1968 Current Population Surveys. Information obtained in February and April was matched with the data secured in March for the 50,000 households. Income reports prior to 1965 only persons included in the February and March Surveys were matched.

Nonmatched persons included in the February and March interviews or the March and April interviews were almost always assigned work experience information from actual respondents with similar economic and demographic characteristics. Work experience values were estimated only when there was a nonmatched person within a given classification, but no respondent with similar economic and demographic characteristics.

Estimates of the proportion of year-round full-time workers in specified subgroups in the population are shown in various tables in this report. All persons in the Armed Forces in February, March, and April 1968 are excluded from the computation of the proportions of year-round full-time workers. In table 16, however, families headed by members of the Armed Forces living off post or with their families on military reservations are included in the base of the percent distribution of families by work experience of head in 1967.

It should be noted that the proportion of year-round full-time workers shown in the Series P-60 reports differs slightly from those shown for the same subgroups in the Bureau of Labor Statistics, Special Labor Force Reports, "Work Experience of the Population." The difference is due largely to the fact that the proportions are not based on exactly the same groups. The proportions presented in the Special Labor Force Reports relate to civilians who worked at some time during the year. In contrast, the proportions shown in the persons tables in the P-60 reports relate to civilians who received income, including not only workers but also many persons who did not work but received income from pensions, interest, dividends, or other sources aside from earnings.

NONRESPONSES AND ALLOCATIONS

In the March 1968 CPS, no information was recorded for approximately 5 percent of the 50,000 households because no interview could be obtained during the week in which the enumeration was conducted. In order to account for these households, the weights assigned to other sample households of similar characteristics residing in the

same sample areas were increased accordingly. In addition, complete income information was not reported for about 17 percent of all families and about 11 percent of all persons 14 years old and over covered by the survey.

In order that the maximum amount of information can be utilized, missing income items are imputed or allocated by values which are obtained from respondents with similar economic and demographic characteristics. Beginning with the survey of March 1962, when a respondent did not answer one or more of the income items, all of his income data were imputed.

Beginning with the March 1966 survey, however, in the event a respondent did not answer one or more of the income questions, the missing income data for this person were imputed for only those income items which were not answered. Each of the earnings items was handled individually, whereas income items other than earnings were handled as a group. Characteristics used in this imputation are age, family status, color, residence, weeks worked, and major occupation group. The income amount assigned to a nonrespondent is that observed for another person with similar demographic and economic characteristics who did respond and who has been selected systematically in the order in which individual records are processed.

In the tabulation of income from surveys prior to 1962, the distributions by income levels had been based only on those cases which reported complete income information. The assumption implicit in this method was that persons who do not provide income information have the same income distribution as those who do provide such information. Using income data for 1958, a comparison was made of the income distributions obtained before and after the assignment of income to nonrespondents on the basis of known demographic and economic characteristics. This comparison indicated that the procedure for making individual assignments of income to nonrespondents resulted in slightly higher estimates of the proportion of families and individuals in the upper income classes than those obtained from the distributions based solely on those reporting on income. (See Current Population Reports, Series P-60, No. 33, tables F and G.)

The use of more advanced electronic equipment has enabled the Bureau of the Census to introduce improved income edit and allocation procedures for the March 1968 CPS data. The main feature of the new procedures was a more refined method for imputing missing income data which expands the use of information already known about that person. Among the major improvements made affecting the

income data are the following: (1) an expanded set of social and economic characteristics within which the imputations are made; in addition to age, color, occupation, and weeks worked, the new procedures include sex and type of family member as major variables within which the missing income items are imputed; (2) the elimination of inconsistent reporting which resulted in having workers with no earnings and earners with no weeks worked; and (3) the new imputation procedure assigns missing

earnings entries first and then utilizes the earnings information to assign missing sources of income other than earnings.

An expanded discussion of nonresponses and allocations may be found in the U.S. Bureau of the Census, Current Population Reports, Series P-60, No. 59, "Income in 1967 of Families in the United States," and No. 60, "Income in 1967 of Persons in the United States."
